

FACADES and URBAN CLUSTERS

General: Facades are used to simulate a side of a building where “enemy” targets may be found. Mounted and dismounted soldiers must identify and engage the targets with the appropriate weapons systems.

The Urban Cluster is used as a training enhancer. Soldiers and vehicle crews must scan the Urban Cluster to ensure there are no potential targets.

Facades: The facade is a structure that simulates a one sided building. The facade has one and two story sections. The facade has the capability of mounting 7 Stationary Infantry Targets (SITs) in windows, doorways, and on the roof.

Facades will be constructed to be used individually and in tandem.

Refer to the Civil Details in the Appendix of this document for detailed drawings of the Facades.

Urban Clusters: The Urban Cluster is a grouping of 5-7 buildings. The buildings are single story four sided structures constructed of plywood. The Urban Cluster has no power or emplaced targets. Doors or windows will be either cut out or painted on the plywood.
